

I am adamantly opposed to implementation of RM-10352 or any changes to allocation or mode on the 160 meter band.

If RM-10352 was implemented, only U.S. amateurs would be limited to cw or digital modes in the lower portion of 160 meters. The band would become like 40 meters where non U.S. amateurs would use ssb in the lower portion and listen for U>S. stations above. This would further reduce the bandspace available to U.S. amateurs not interested in long distant contacts or contesting and possibly cause interference to stations already using a frequency.

Implementation of RM-10352 would not be in the best interest of the majority of U.S. amateurs.
